AASHTO TAMP Builder

via NCHRP PROJECT 08-36 (116)

What is the TAMP Builder?

MAP-21 requires state transportation agencies to develop risk-based transportation asset management plans (TAMPs). The AASHTO TAMP Builder is a web tool that makes it easier to develop your TAMP – using available TAMPs. It allows you to easily customize the structure and contents of a MAP-21 compliant TAMP outline.

The core features of the TAMP Builder work by getting your input to a few simple questions. Based on this information, the site assembles an annotated TAMP outline that includes guidance and links to specific sections of existing TAMPs. The site also offers a searchable database of existing TAMPs and an option to download a basic TAMP outline.

Together, these features of the TAMP Builder are designed to help you answer questions like:

- *How can I find examples of specific TAMP sections and chapters that meet my agency's needs?*
- *How can I identify existing TAMPs created by peer agencies?*
- *Where can I find a basic outline in order to get started developing my agency's TAMP?*

The AASHTO TAMP Builder relies on a database of existing TAMPs to provide guidance, models, and example resources.

At this time there are few examples of MAP-21 compliant TAMPs and the MAP-21 rulemaking process is still underway. As USDOT's MAP-21 rulemaking advances and transportation agencies complete their MAP-21 compliant TAMPs, the TAMP Builder will continue to be strengthened.

In the meantime, the TAMP Builder website is available today to help your TAMP development process.
